Loker — Master Product Guide

Version 0.4 · October 2026

A chat-first job platform for Indonesia, modeled on BOSS Zhipin (zhipin.com).

1. What Loker is

Loker (Indonesian slang for "job vacancy") is a **chat-first job platform**. Job seekers message the **employer directly** — no HR middleman, no *calo* (brokers) — guided by an **AI match score**, with an anti-scam **"Verified Employer"** badge as the core trust promise.

> **Tagline:** *"Chat langsung dengan bosnya — tanpa perantara, tanpa penipuan."* / *"Chat directly with the boss — no middlemen, no scams."*

It mirrors BOSS Zhipin's *Direct Recruitment Model* (mobile-native + recommendation feed + instant direct chat) and adapts it to Indonesia with a local trust layer and full bilingual support.

2. The problem

- - Indonesian job boards (JobStreet, Kalibrr, Glints) skew **white-collar** and are **resume-upload / one-way** — applications disappear into a void.
- - **Blue-collar and first-job seekers** (the majority of the workforce) are underserved.
- - **Scams and fake listings** are a major, widely felt pain point.
- - There is **no direct line to the decision-maker**; HR is a slow middleman.

3. Who it's for

Persona	Description	Need
Andi (primary)	18–30, blue-collar / first job, mobile-first, low data budget	Find a legit job fast, talk to a real boss, avoid scams
Bu Sari (employer)	SME owner (F&B, retail, logistics)	Hire quickly without HR or consultants

4. How it works — the core loop

- 1. **Sign in** (account or guest) and pick a language.
- 2. **Onboarding** — choose seeker or employer, enter your name.

- 3. **Discover** — a recommendation feed of dense job cards with an AI match %.
- 4. **Filter** — city, experience, education, salary, type, industry category.
- 5. **Open a job** — see the employer, verification, response rate, and benefits.
- 6. **Chat directly with the boss** — using quick replies or prewritten templates.
- 7. In recruiter mode, the employer flips the switch and sees a **candidate feed**.

5. Feature reference

#	Screen	Function
0	Auth	Login / Sign up, guest access, validation, demo credentials, language switcher
1	Onboarding	Role picker, name entry
2	Discover feed	Dense job cards: salary + bonus, tags, commute, company, recruiter + online + response rate, match %
3	Filters	City / Experience / Education / Salary / Type + industry chips
4	Job detail	Description, employer profile, mass apply
5	Company profile	Verified, industry, size, funding, rating, reviews, open roles
6	Chat thread	1:1 chat, templates, action bar (call / share contact / send résumé / not interested)
7	Chats list	Filter tabs: All / Unread / New / Interview / Not interested
8	Saved jobs	Bookmarked jobs
9	Recruiter mode	Candidate feed with match %, chat
10	Profile / Settings	Virtual résumé, language, privacy, VIP teaser, logout

6. Chat & hiring flow

- - Either side can start the conversation; the chat is tied to the job poster.
- - **Prewritten templates** speed up first contact (no cover letter needed).
- - The **action bar** lets users call, exchange contact, send a résumé, or mark not-interested.
- - **Response rates** are shown so both sides are nudged to be responsive (a Zhipin signature).

7. Trust & anti-scam (the wedge)

- - **Verified Employer** badge on vetted companies.
- - **Blocked companies** — users can hide an employer's jobs.
- - **Hide profile** privacy toggle.
- - A "Why Loker?" panel reinforces the no-scam, no-broker promise.

8. Bilingual

Full **English ⇄ Bahasa Indonesia**, switchable on the login screen, onboarding, and settings; the choice persists. All content (jobs, employers, candidates, chat) has translated variants.

9. Data model (client state)

Top-level keys:

`me, role, employers, jobs, chats, saved, notifications, filters, auth, onboarded, lang, accounts, mode, applications, privacy, vip, candidates`

Key collections: `jobs` (title, salary, tags, experience, education, bonus, commute, city, category, recruiter, match, verified), `employers` (industry, size, funding, rating, reviews), `candidates` (recruiter-mode), `chats` (messages + tag).

10. Technical architecture

`

apps/loker/

web/index.html desktop build (single-file, offline)

web/mobile.html mobile build (single-file, offline)

server/server.py stdlib HTTP server, port 8791, SQLite, /api/*

tests/ verify_api.py + test_static_integrity.py

docs/ PRD + this guide + validation plan

`

- - **Zero dependencies.** Front-end is one self-contained HTML file; backend is Python standard library only.
- - **Offline-first.** Double-click the HTML and it works with no server.
- - **Optional persistence.** The server injects state at serve time; on-disk files stay byte-pristine.
- - **CI.** Wired into the monorepo's `build_site.py`, `check_site.py`, and `run_all_tests.py`.

11. How to run

With backend (data persists):

`powershell

cd "C:\Users\juwen_lie\Documents\Default Project"

python apps\loker\server\server.py

`

Open `http://127.0.0.1:8791/`. Demo login `demo@loker.app` / `demo123`, or Continue as guest.

Offline: double-click `apps/loker/web/index.html` or `web/mobile.html`.

12. Monetization

- - **Primary:** employer-side paid engagement / subscriptions (seekers rarely pay).
- - **VIP tier:** candidate premium (visibility boost, "who viewed you").
- - **Possible attach:** jobs as a funnel for **fintech** (earned-wage, micro-loans).

13. Roadmap

Phase	Scope	Status
0. Prototype	Screens, i18n, offline, backend	Done
0.1 Auth	Login/signup/guest/logout	Done
0.2 Browse	Dense cards, filters, categories, company pages	Done
0.3 Features	Chat tabs/templates, dual-mode, résumé, privacy, VIP	Done
1. Validation	10 employer interviews	Next
2. Pilot	One city + vertical; real employers	Planned
3. Monetization	Employer subscriptions; real messaging	Planned

14. Validation (the next real step)

Before more features: run **10 employer interviews** in one niche to test willingness to pay. See the **Employer Validation Plan**. Success = **3+ employers willing to pay** for a pilot.

15. FAQs

- - **Is this production-ready?** No. It is a feature-complete prototype with mock data.

- - **Does login really work?** It is client-side (demo accounts + guest); there is no auth server.
- - **Is messaging real-time?** No — replies are simulated.
- - **Does it need to be online?** No. It works offline; the server only adds persistence.
- - **Is the employer verification real?** No — the badge is demonstrated, not enforced.

16. Honest limits

Loker is a **demo**, not a competitor to a $9B company. Real competition is **liquidity in one niche** plus **proven willingness to pay** — not more features. Validate before building further.

Built as the 4th app in the `apps/` monorepo, alongside Orbis, Peers, and House of Articles.
